Deependra Pandey

What is Phishing?

- Phishing is a type of cyber attack in which attackers try to steal sensitive information such as usernames, passwords, bank details, and personal data by pretending to be a trusted person or organization.
- Phishing attacks are commonly carried out through:
 - • Emails
 - • Fake websites
 - • SMS messages (Smishing)
 - • Phone calls (Vishing)
 - • Social media messages

Types of Phishing Attacks

- There are several types of phishing attacks:
 - • Email Phishing – Fake emails pretending to be from trusted organizations.
 - • Spear Phishing – Targeted phishing attacks aimed at a specific individual or organization.
 - • Smishing – Phishing attacks sent through SMS or text messages.
 - • Vishing – Voice phishing using phone calls to trick victims.
 - • Clone Phishing – A legitimate email is copied and modified with malicious links or attachments.

How to Recognize Phishing Emails

- Look for these warning signs:
 - • The sender's email address looks suspicious.
 - • The message creates urgency or threatens immediate action.
 - • It contains spelling or grammar mistakes.
 - • Links point to unknown or fake websites.
 - • Unexpected attachments are included.
 - • The email asks for passwords, OTPs, or bank details.

How to Identify Fake Websites

- Before entering personal information, always check:
 - The website uses HTTPS ( secure connection).
 - The URL is spelled correctly (e.g., amazon.com, not amaz0n.com).
 - Look for poor design, spelling mistakes, or broken links.
 - Avoid websites asking for unnecessary personal or banking information.
 - Verify the website before making payments or logging in.

Social Engineering Techniques

- Social engineering is the practice of manipulating people into revealing confidential information.
- Common techniques include:
 - • Pretending to be a trusted person or organization.
 - • Creating fear or urgency to force quick decisions.
 - • Offering fake rewards, prizes, or job opportunities.
 - • Requesting passwords, OTPs, or personal information.
 - • Building trust through phone calls, emails, or social media.

Best Practices to Stay Safe

- Follow these cybersecurity best practices:
 - • Never click on suspicious links or attachments.
 - • Always verify the sender before responding.
 - • Use strong and unique passwords.
 - • Enable Two-Factor Authentication (2FA).
 - • Keep your operating system and antivirus software updated.
 - • Never share passwords, OTPs, or banking details with anyone.
 - • Report phishing emails to your organization or email provider.

Real-World Phishing Example

- Example:
- A user receives an email claiming to be from their bank.
- The email asks the user to click a link and verify their account immediately.
- The link opens a fake banking website that looks genuine.
- The user enters their username and password, allowing attackers to steal their login credentials and potentially access their bank account.
- Lesson:
- Always verify the sender and the website URL before entering sensitive information.

Interactive Quiz

- 1. What is phishing?
 - A) A cyber attack
 - B) A programming language
 - C) An antivirus
- 2. Which protocol indicates a secure website?
 - A) HTTP
 - B) HTTPS
 - C) FTP
- 3. Should you share your OTP with anyone?
 - A) Yes
 - B) No
- Answers:
 - 1-A
 - 2-B
 - 3-B

Thank You

- Thank You!
- Stay Safe.
- Stay Alert.
- Think Before You Click.
